Cold abscess symptoms

A closed nose is not a picnic. It usually affects breathing and is generally dislodged to say. When suffocating noses occur that accompany the cold, blood vessels expand, mucus membranes become congested (full of excess blood) and the nose becomes suffocating or blocked. Once the cold virus enters the nose, histamine is released and this increases blood flow to the nose. Then the nasal tissues begin to swell, and this stimulates the nasal membranes to produce excessive amounts of mucus. Advertising You can treat a stuffy nose with decongestants, nose drops or sprays. Sneezing Sneezes is caused by irritation of the soft lining of the nose or throat. When sneezing inhales air, the larynx closes so that the air pressure in the lungs is increased, then suddenly the larynx reopens and sends an air rush through the nose and mouth. Treating sneezing can be counterproductive since it is the body's attempt to erase offensive irritants associated with colds. The best way to prevent sneezing is to remove irritants, say gentle nose blowing helps. For sneezing associated with allergies, antihistamines can do the trick, but they have no place in the treatment of colds. Get the facts about the symptoms of cold and how they differ from those of other conditions. Plus, learn about common cold complications like sinusitis and bronchitis, and learn how colds can affect children, pregnant women, and people with chronic diseases. Is it really a cold? Your nose's running, you've got a cough, and your throat's raw. How can you tell if you have a cold, allergies or flu? Some telltale signs can help you distinguish them. Cold against flu While cold symptoms can make you feel sick for a few days, flu symptoms can make you feel quite sick for a few days or weeks. Cold vs allergies How can you distinguish between a common cold and allergies? Sometimes it's a tough call, but how long your problems last is one of the big clues. Signs It could be something more serious. The common cold is usually not a cause for concern, but sometimes it can lead to more serious problems. When to call a doctor When is it time to get some advice from a professional? Take stock of your cold symptoms and see if they fit one of these models. Breast infections A breast infection, or sinusitis, can occur in the wake of a cold or with allergies. Ear infections Symptoms of a middle ear infection (acute otitis media) often begin 2 to 7 days after the onset of a cold or other upper respiratory infection. Children and colds Learn more about colds in children: prevention, symptoms, treatments and when to call your doctor. Colds and medical conditions A common cold can aggravate some chronic medical conditions. Learn how to prevent more serious health problems if you have a cold. Asthma and colds If you have asthma, catching a cold can get worse or trigger symptoms. Heart disease and colds If you have heart disease, take to avoid catching a cold. Sometimes it can lead to complications that can cause serious problems. Diabetes and colds They are not fun for anyone, but if you have diabetes, everything that smells and sneezes has an extra risk. AIDS, HIV and colds If your immune system is weakened by HIV/AIDS, you need to protect yourself from colds and flu, which can lead to more serious diseases. 1/13 Wondering why you feel cold? This condition could be a cause. Anemia occurs when you don't have enough healthy red blood cells to bring your body all the oxygen it needs. It will leave you tired, weak, stunned and short of breath. It can also make you cold, especially your hands and feet. Your doctor will find the cause and tell you if you need changes in your diet, supplements or other treatment. Swipe to advance 2/13 It is when the thyroid gland in the neck does not make enough of some hormones. It can make you cold-sensitive. You may also have sore joints, constipation, dry skin, and weight gain. Symptoms can take years to show up. Hypothyroidism can be caused by many things, including diseases or treatments for other conditions. Your doctor can prescribe artificial hormones to replace those your body doesn't. Swipe to advance 3/13 When you have it, the blood vessels in your hands act excessively at cold temperatures or stress. During an attack, which usually lasts from a few minutes to an hour, they restrict and limit blood supply. This can make the fingers and toes cold and numb and can turn white or blue. When the blood returns, they can begin to dye or even hurt. Medicine can relieve symptoms and prevent tissue damage. You may need surgery if it's a serious case. Swipe to advance 4/13 Diabetes and hypertension often cause kidney disease. Waste can accumulate at dangerous levels because the kidneys do a bad job of filtering blood. This can lower your body temperature and cause other problems. Kidney disease is also linked to anemia, which can make you feel cold even when it's hot outside. It can get relief when your doctor treats kidney disease. Swipe to advance 5/13 It happens when the plaque narrows the arteries and makes it harder for the legs, and sometimes the arms, to get enough blood. If one leg is much colder than the other, especially if it is also painful, numb or weak, it could be a sign of the disease. Get emergency medical assistance if you notice these symptoms. Changes in diet and exercises can sometimes help, but your doctor may suggest medication and sometimes a procedure or surgery to treat it. Swipe to advance 6/13 It is an eating disorder that leads you to drastically reduce your calories and can make you dangerously thin. Lack of body fat can always leave you cold, especially in your hands and feet. This condition can be life-threatening. Talk to a doctor if you think you or a loved one has this disorder. Swipe to advance 7/13 It is caused by a virus that affects your whole body, including your own throat, and lungs. You can have high fever and chills along with headaches, muscle aches, cough and weakness. It can be serious, especially for children and older adults. Get an annual flu vaccine to help stay healthy. Swipe to advance 8/13 If your feet feel cold but aren't cold to the touch, it could be a sign of this condition. It often starts from the toes and moves up the leg. It happens when an injury or medical condition damages the nerves. Diabetes is a common cause. You can also get it due to infections, liver or kidney diseases, you do not get enough vitamins or contacts with toxic chemicals. Your doctor can treat the cause of the problem. Swipe to advance 9/13 It can bring anemia, which can make you cold. You can get vitamin B12 when you eat chicken, eggs and fish. Some cereals and other foods are also fortified. Keep in mind that you may not have enough B12 although you eat a lot of food with it. Some people have difficulty absorbing the vitamin due to a disease or medications they take. Swipe to advance 10/13 Without the right amount of this nutrient, you can get iron deficiency anemia, which can make you cold. It can be caused by blood loss, a poor diet or because your body can't absorb it well. The best source is red meat, but it is also in poultry, pork and fish. Some non-meat sources include bread and cereals fortified with iron, peas, soy, chickpeas, and dark green leafy vegetables. Swipe to advance 11/13 It happens when the pituitary gland does not make enough of some hormones. A typical symptom is that you are sensitive to the cold or find it difficult to stay warm. You may also have anemia, lose your appetite and lose a few kilos. Your doctor will try to treat the cause of your hypopituitarism or suggest drugs that replace the missing hormones. Swipe to advance 12/13 Some medications can make you feel colder as a side effect. Beta blockers, for example, help the heart relax and prevent your body from creating harmful chemicals in response to heart disease. But you may also feel dazed, tired, nauseous and colder in your hands and feet. Talk to your doctor. They may suggest you change medication or lower your dose. Swipe to advance 13/13 It may seem to warm you up at first because it floods the blood of enlarged blood vessels just below the skin. But your temperature will drop as your body pulls blood away from your core to heat the surface of your skin. Alcohol also depresses the part of the brain that regulates temperature. With freezing weather, this can make you dangerously cold, a condition called hypothermia.
